Why Explore the Giant Planets?

Solar System Studies

• The Giant Planets had significant influence on the early history, evolution, development of the solar system: Thought to have deflected icy planetesimals containing water and other volatiles to inner solar system from region of Neptune. Detailed comparisons of internal structures and compositions of gas giants with ice giants will yield valuable insights into processes that formed the solar system.

• Comparative planetology of deep well-mixed atmospheres of the Outer Planets is key to the origin and evolution of the solar system. (Atreya, Outer Planets Forum, Pasadena, June 2004)

• Comparison between Ice Giants and Gas Giants cannot proceed until our understanding of Ice Giant systems is at the level of Gas Giants.
Why Explore the Giant Planets?

Extra Solar Planetary Studies

• The Giant Planets provide context / initial point of comparison and understanding of extrasolar Giant Planets.

• Rings around the Giant Planets are the closest analog in our solar system to circumstellar disks from which planets form.

Exploration of the Giant Planets
Gas Giants and Ice Giants

Background

Extensive studies of the two Gas Giants Jupiter and Saturn have been conducted, but only “snapshot studies” of the Ice Giants.

- Jupiter
  - Galileo: 8 years: Dec 1995 --> Sept 2003
  - Flybys: Pioneer, Voyager, Ulysses and Cassini
- Saturn
  - Cassini: 1 year, continuing for many years
  - Flybys: Pioneer, Voyager
- Uranus
  - Voyager 2 flyby on 24 Jan 1986
- Neptune
  - Voyager 2 flyby on 25 Aug 1989
Ice Giants: Key Scientific Questions

- **Atmospheric Dynamics and Structure**
  - Energy source
  - Depth of zonal structure, latitudinal variations
  - Similarities / differences between Ice Giants and Gas Giants; between Uranus and Neptune

- **Atmospheric Chemistry**
  - Composition as function of altitude
  - Composition of bright and dark features

- **Planetary Interiors and Magnetic Fields**
  - Asymmetry of magnetic fields (relative to Gas Giants)
  - Source and stability of magnetic fields

- **Rings and Icy Satellites**
  - Stability of ring arcs; resonant model
  - Composition
  - Triton’s N2 atmosphere, origin, structure, stability, evolution
  - Similarities with KBOs
Rich scientific return and connections to astrophysical problems beyond the solar system, including

- Atmospheric structure & dynamics (e.g., atmospheric dynamics of distant, rapidly spinning planets with a “bottomless atmosphere”)
- Triton as KBO / “icy time capsule” of dynamical and chemical processes in early solar system
- Ring arcs - unique among rings in solar system (comparative ringology); rings are best analog for initiation of solar system formation from circumstellar disk
- Orientation of magnetic field provides opportunity to study diurnal forcing of magnetosphere (once per day)
Why Neptune?
-Triton-

- Triton as captured KBO - low altitude flybys and lander(s) possibly provide best means for long term studies of a KBO
- Pluto - Triton comparative planetology
- Triton - Titan comparative planetology
- Origin of N2 atmospheres (Triton at 35 °K vs. Titan)
- Dynamics and structure of tenuous atmospheres
- Geysers / solid state greenhouse
- Possible prebiotic chemistries
- Other icy and irregular satellites as possible captured KBOs

References
NEPtune Science Goals and Objectives

- **Origin and Evolution of Ice Giants** Neptune atmospheric elemental ratios relative to hydrogen (C, S, He, Ne, Ar, Kr, Xe) and key isotopic ratios (e.g., D/H, $^{15}\text{N}/^{14}\text{N}$), gravity and magnetic fields. [Probes, Orbiter]

- **Planetary Processes** Global circulation, dynamics, meteorology, and chemistry. Winds (Doppler and cloud track), trace gas profiles (e.g., $\text{PH}_3$, CO, ortho / para hydrogen); cloud structure, microphysics, and evolution; photochemistry and tracers of thermochemistry (e.g., disequilibrium species). [Probes, Orbiter]

- **Triton** Origin, plumes, atmospheric composition and structure, surface composition, internal structure, and geological processes [Orbiter, Lander]

- **Rings** Origin / evolution, structure (waves, microphysical, composition, etc.) [Orbiter]

- **Magnetospheric and Plasma Processes** [Orbiter]

- **Icy Satellites** Origin, evolution, surface composition and geology [Orbiter]
**NEPtune Mission Overview**

- Use of NEP (nuclear electric propulsion) to support a large payload mass and provide adequate power for high-data rate return and simultaneous operation of all orbiter instruments.
- Jupiter flyby 4 years after launch reduces total transit time to 12.9 years.
- First probe separated at 62 days prior to entry, followed by orbiter deflection maneuver.
- Second deflection maneuver required to release second probe.
- 5 hour descent missions for both probes.
- Transfer to Triton lander release orbit and long duration Triton observation period.

Outer Planets Assessment Group
NEPtune Probe
Candidate Science Payload

- Gas Chromatograph / Mass Spectrometer (GCMS)
  - Composition profiles, noble gases, isotopic ratios, hydrocarbons
- Atmospheric Structure Instrument (ASI)
  - P / T profiles; acceleration measurements in upper atmosphere → density
- Net Flux Radiometer (NFR)
  - Radiative balance
- Nephelometer
  - Cloud particle size, density, microphysics
- Helium Abundance Detector
- Doppler Wind Experiment (DWE)
- Analog Resistance Ablation Detector (ARAD)
- Ortho / Para H$_2$ detector
- Lightning detector
NEPtune Triton Lander
Candidate Science Instruments

- Surface Science Package including
  - Physical properties instrument (density, electrical & thermal properties)
  - Color panoramic camera
  - Surface sampling device
  - Seismometer
  - Near IR Spectrometer
- Gas Chromatograph / Mass Spectrometer (atmosphere and surface composition)
- Atmospheric Structure Instrument (pressure and temperature during descent and on surface)

</table>

- Launch in Jan 2016
- Jupiter flyby in 2020
- Probe Entries in Jan & July 2029
- Probe #1 on prograde entry
- Probe #2 on retrograde entry
- Probe data return for 5 hours after entry
- Triton Orbit in Oct 2033
- Lander released following Triton orbit
NEPtune Orbiter Technology Development Needs

- Electric propulsion capability for continuous, long duration thrusting
- Mission design to support Orbiter science, multiple Probe / Lander targeting, separation, and telemetry links
- Launch vehicle strategy for heavy lift or on-orbit spacecraft assembly
- Development of lunar ISRU capability for launch from lunar base
- Shielding techniques to protect sensitive electronics from high radiation levels of nuclear reactor
NEPtune Probe Technology Development Needs

- Thermal protection system (TPS) and test facilities for 25 km/s Neptune entry condition
- Staging system to separate pressure vessel from deceleration module
- Pressure vessel design to maintain internal environment over 20+ year mission duration
- Probe penetration design for multiple windows and inlets
- High power / high efficiency transmitter and communications strategy for transmission through absorbing Neptune atmosphere
- Probe antenna for low frequency relay link from deep atmosphere
- High density battery design for operation after long transit period during 5 hour descent period
- Thermal design to maintain internal environment to acceptance limits for all electronics and mechanical systems
NEP'tune Lander Technology Development Needs

- Thermal design to maintain internal lander temperatures within acceptance limits on the 35 °K Triton surface
- Active, propulsion and landing systems to target specific landing site
- Lander antenna to maintain link with Orbiter
- Surface sampling system to access uncontaminated Triton surface
- Drill to access subsurface material
