

# The Evolvable Mars Campaign - The Moons of Mars as a Destination

July 30, 2014

**Pat Troutman**

Human Spaceflight Architecture Team (HAT)

NASA Langley Research Center

- **Mike Gernhardt**  
**Leading HAT work on designing Mars moon missions**
- **Josh Hopkins**  
**Lockheed Martin – Mission design across Phobos & Deimos**
- **Dan Mazanek**  
**Led Original HAT work on Mars moon missions**

**EARTH  
RELIANT**

# **WHY Send Humans into Space?**

**PROVING  
GROUND**

*According to me.....*

**To expand the human sphere of influence beyond Earth in order to further knowledge, enhance our quality of life, and assure humanity's survival**

**EARTH  
INDEPENDENT**

# Strategic Principles for Exploration Implementation

Six key strategic principles to provide a sustainable program:

- Implementable in the ***near-term with the buying power of current budgets*** and in the longer term with budgets commensurate with economic growth;
- Application of ***high Technology Readiness Level*** (TRL) technologies for near term missions, while focusing sustained investments on ***technologies and capabilities*** to address challenges of future missions;
- ***Near-term mission opportunities*** with a defined cadence of compelling human and robotic missions providing for an incremental buildup of capabilities for more complex missions over time;
- Opportunities for ***U.S. commercial business*** to further enhance the experience and business base learned from the ISS logistics and crew market;
- ***Multi-use, evolvable*** space infrastructure;
- Substantial ***international and commercial participation***, leveraging current International Space Station partnerships.

# **Evolvable Mars Campaign: Guiding Philosophy**

- **Leverages strong linkage to current investments in ISS, SLS, Orion, ARM, EAM, technology development investments, science investments**
- **Develops Earth independence for long-term human presence leading to the surface of Mars, starting in the Proving Ground, through the cis-lunar environment, enabling science along the way, and providing infrastructure for human exploration missions to Mars and beyond**
- **Accommodates a realistic budget, both in escalation and peaks coupled with a cadence of significant missions**
- **Starts off minimalist, grows as resources and capabilities permit**
- **Emphasizes prepositioning and reuse/repurposing of systems when it makes sense**

Not THE plan, but a framework for guiding strategy and investments that will mature as technology, discovery and programmatics evolve

# Evolvable Mars Campaign – Capability & Mission Extensibility

EARTH RELIANT

PROVING GROUND

EARTH INDEPENDENT

## Capabilities

International Space Station

70+ MT SLS

Asteroid Redirect Vehicle

105+ MT SLS

Advanced Propulsion

EDL Pathfinder

EDL/Lander

130+ MT SLS

Long Duration Habitat

Long Duration Surface Systems

Staying Healthy

Exploration Augmentation Module

Transportation

Working In Space

ISRU

EM-X Crewed Missions in Cis-lunar space

Mars 2020

Asteroid Redirect Robotic Mission

Proving Ground Missions to Returned Asteroid & EAM for Mars risk reduction

ISS Deep Space & Mars Risk Reduction

Deep Space Mars Preparation

All Paths Through Mars Orbit

Mars Moon Missions

First Human Mission to Mars Surface

Long Duration Human Missions

## Missions

# WHY Send Humans the Moons of Mars??

Phobos  
27x22x18 km

Deimos  
15x12x10 km

2 km

# The Moons of Mars are Unexplored and Intriguing!

Where did they come from?

What can we learn about Mars from them?

What do they mean for the future of Mars?

## Potential Science Activities

- Determine the nature of the surface geology on Phobos / Deimos and age of materials
- Constrain the conditions of formation of Phobos and Deimos materials
- Characterize the regolith on Phobos / Deimos in its geological context, and interpret the processes that have formed and modified it
- Identify and characterize the presence and distribution of any potential volatile or organic species
- Determine the near surface and interior structure at global and regional scales
- Find and analyze presolar grains
- Characterize Phobos' and Deimos' energy budget
- Perform astrophysics, heliophysics and Mars observations
- Add probably much more

# The Moons of Mars are More Accessible than the Surface of Mars

## Getting to Mars

# The Moons of Mars are More Accessible than the Surface of Mars

## Getting to Mars

# The Moons of Mars are More Accessible than the Surface of Mars

## Getting to Mars

**DESTINATION  
SYSTEMS & CREW  
RETURN VEHICLE**  
SEP pre-deploy to  
Mars orbit

Transit: 2-3 Years

**PHOBOS  
DESTINATION  
SYSTEMS**  
SEP pre-deploy to  
Phobos

Transit: 2-3 Years

**TRANSIT HAB  
TO MARS**  
Aggregate in  
Cis-lunar space

**CREW/TRANSIT HAB**  
Aggregation in  
HEO/DRO

**CREW**  
Launch to  
Cis-lunar space

6-9 Months  
**CREW/TRANSIT HAB**  
To Mars orbit via chemical propulsion

**HABITATS** return to staging  
point for refurbishment

6-9 Months  
**CREW/TRANSIT HAB**  
Return to Earth & DRO

**CREW** direct return to Earth

**Surface Operations:**  
30-500 Days

## Returning to Earth

# Preliminary Comparison of Surface Habitat vs. Parking Orbit Options

Effective Dose Equivalent					
	1977 Solar Min	1991 Solar Max		Percent of Free Space	
Free Space	0.8264	0.3987	mSv/day	100%	100%
L4/L5	0.798	0.385	mSv/day	97%	97%
20 km DRO	0.763	0.368	mSv/day	92%	92%
L1	0.623	0.300	mSv/day	75%	75%
Lunar Surface	0.4299	0.21	mSv/day	52%	53%
Phobos Surface	0.401	0.196	mSv/day	48%	49%
Mars Surface	0.3323	0.1728	mSv/day	40%	43%
Phobos Surface w/ 10 deg Crater Rim	0.326	0.159	mSv/day	39%	40%

Location	Station-keeping Delta-V per Day (m/s)	Roundtrip Delta-V per Transfer (m/s)	Cumulative Delta-V * (m/s)	Roundtrip Time per Transfer (hrs)	Cumulative Transfer Time (days)
L1 (1 m Position Error)	0.22	8	457	4	4.7
L1 (10 m Position Error)	1.30	8	1537	4	4.7
20 km DRO, 0 incl.	Very Low	24.6	738	4.1	5.1
L4		64.0	1921	140.5	175.7
150 km DRO, 0 incl.		63.8	1914	10.0	12.5
150 km DRO, 10 deg incl.		76.9	2307	10.9	13.6
200 km DRO, 0 incl.		82.1	2464	10.1	12.6
200 km DRO, 10 deg incl.		99.4	2982	11.0	13.7

- L1 may be acceptable from DV, crew time, and radiation perspective but unstable orbit and potential surface impact is a concern

# Low Gravity Has its Advantages.....

Weight on Phobos	lbf
Crewmember in a Suit	0.3
PEV (6,000 kg)	7.7
Habitat (15,000 kg)	19.2
Lander (50,000 kg)	63.9

Unpressurized Excursion Vehicle

Pressurized Excursion Vehicle

# EMC Progressive Expansion of Capabilities and Distance

## Low-Earth Orbit

- International Space Station: **Answer the question: Can humans live & operate ~900 days in micro-G?**
  - Zero-g, human factors research platform
  - Highly reliable life support, adv. logistics, low maintenance
  - Environmental monitoring
  - Supportability & maintenance concepts

## Phobos/Deimos/Mars Orbit

- Deep Space Port plus:
  - High power SEP (xxx kW)
  - ~900 day deep space habitat(s)
  - Deep space countermeasures
  - Mars vicinity propulsion

## 4. Mars Surface

- Phobos/Deimos plus:
  - Mars entry & landing systems
  - Partial-gravity countermeasures
  - Long duration surface Systems (ISRU, fission power)

Continued Leveraging  
of Commercial &  
International Partnerships

## SLS, Orion & ARM

- Distant Retrograde Orbit
  - Heavy lift launch (SLS), Orion
  - Crew support for up to 30 days (Orion)
  - Deep-space propulsion (Orion)
  - SEP demonstration (40 kW)
  - AR&D

## Deep Space Proving Ground

- SLS, Orion & ARM plus:
  - Exploration Augmentation Module
    - Crew support for 30-60 days (habitat)
    - Uncrewed for up to 11 months
- **Answers the question "Can human class systems operate in a deep space environment in a crew tended mode for long durations"**
  - Advanced EVA (Suit, PLSS)
  - In-Space Propulsion (EUS)
  - Deep space long duration systems and operations testing
  - Aggregation of Mars Mission Vehicles

# Asteroid Redirect Mission Synergies with Mars Moon Missions

ARM could yield an enhanced understanding of proximity and landing operations associated with uncooperative, low-G targets as will be experienced with Mars Moons

# The Moons of Mars are Potential Enablers for Mars Surface Exploration

## *Mission Flexibility*

- Opens up conjunction class mission modes where the crew and time spent shift from a Mars moon to the surface of Mars with equal radiation protection
- Offers “abort to moon” option as a contingency for Mars surface emergencies

## *Tele-operation of Mars Surface Assets*

- Human presence extended to the surface of Mars safely using the best of humans and robots together
- Conjunction class mission to Mars moons offer ~500 days of low-latency tele-operations on the Mars surface in support of Science, reconnaissance and infrastructure deployment

## *ISRU*

- To be truly Earth Independent and sustainable, ISRU beyond Mars atmosphere will have to be leveraged
- The Moons of Mars may offer a source of propellant for landers, taxis and Earth return vehicles

# Summary – Why the Moons of Mars as a Human Destination

## *Unexplored and Intriguing*

- Rich science
- A link to Mars past and its future
- Incredible views

## *A More Achievable Step*

- Same crew transportation system as Mars surface
- Low gravity environment for access and exploration
- Less investment than Mars surface required

## *An Enabler for Mars Surface Exploration*

- Alternate mission modes opened up
- Low latency tele-operations of Mars surface assets
- ISRU potential for sustainable pioneering of Mars
