The prestigious University of Arizona Press Space Science Series — with 40 current titles — provides the planetary and space science community with a set of reference and source volumes that act as benchmarks for our current understanding of the field. The collaborative agreement between the LPI and the Press that began in 2000 has allowed the Series to continue and allows the Press to offer the volumes at an affordable price, keeping them within reach for everyone, particularly students and early career scientists.

"Space Science Series books are found on the desks and shelves of virtually every practicing planetary scientist."
