

CHECK IT OUT	WHAT TO DO	WHAT TO ASK...
<p><b>1</b></p> <p>The early Moon was hot from its formation. Its rocks - at least the upper layer - were molten.</p> <p>The bottle of water represents the ocean of molten rock — magma — that covered the Moon just after it formed.</p> <p>There are different items set out on the table. Some float in water and others sink. You will use the cup of water to test them.</p>	<p>Make some predictions...</p>	<p>Which items will <b>sink</b> and which will <b>float</b>?</p>

CHECK IT OUT	WHAT TO DO	WHAT TO ASK...
<p><b>2</b></p> <p>Test your predictions!</p>	<p>Add <b>one piece</b> of each type of item to the cup of water.</p>	<p>Why did <b>some items float and others sink</b>?</p> <p>Which items could <b>represent dense minerals</b> on the Moon?</p> <p>Which items could <b>represent the materials that floated</b> to the top of the magma ocean?</p>

CHECK IT OUT	WHAT TO DO	WHAT TO ASK...
<p data-bbox="407 500 470 581"><b>3</b></p> <p data-bbox="159 630 730 824">There were <b>different materials inside the early Moon's outer layers</b>, and at first, they were all mixed together.</p> <p data-bbox="201 889 688 1036">Use the items you tested to <b>make a model</b> of the infant Moon's super-hot rock soup!</p>	<p data-bbox="781 581 1318 873"><b>Choose two types of items - one that sinks and one that floats - to add to your bottle. (Or, pour the water out into a pitcher or bucket and use a different liquid instead!)</b></p> <p data-bbox="768 938 1331 1140"><b>Use the funnel to add a <i>small</i> handful of each to the bottle.</b> If you are adding a liquid, pour in just two to three tablespoons.</p> <p data-bbox="772 1205 1327 1295"><b>Tighten the cap on the bottle, shake it, and watch carefully.</b></p>	<p data-bbox="1373 786 1936 1084">Once everything has settled, <b>note the order</b> of the three different layers. What is on the very bottom? What is in the middle? Which items floated to the top?</p>

CHECK IT OUT	WHAT TO DO	WHAT TO ASK...
<p style="text-align: center;"><b>4</b></p> <p style="text-align: center;"><b>The rock on the table - anorthosite - formed on Earth.</b></p> <p>There are also anorthosite rocks on the Moon. They are made of minerals (called plagioclase feldspar) that floated to the top of the magma ocean and solidified as rock.</p>	<p style="text-align: center;"><b>Feel and study the rock.</b></p> <p>Rocks like these on the Moon were the first to form, 4.5 billion years ago. We are lucky to be able to study these old Moon rocks.</p> <p>None of the Earth's "infant" rocks are left. Processes on Earth - the rock cycle - recycled them all.</p>	<p style="text-align: center;">Is the <b>color</b> of the rock relatively light or dark? On the Moon, rocks that formed during its "infancy" have this same kind of coloring.</p>

CHECK IT OUT	WHAT TO DO	WHAT TO ASK...
<p><b>5</b></p> <p>Rocks like the Earth rock were found on the Moon and brought back to study in laboratories!</p> <p><b>Scientists are still looking inside lunar rocks for pieces of infant crust</b> to learn more about how the early Moon cooled.</p>	<p><b>Check out the Moon map</b> and see where these types of rocks – the oldest on the Moon! – are usually found.</p> <p>Notice how these areas are relatively light in color, similar to the light-grey color of the Earth rock.</p>	<p>Go outside sometime and look at the Moon. Can you <b>find these light-grey areas on the Moon?</b></p>

## CHECK IT OUT

6

Scientists also use computers to help them imagine and test their ideas about how the Moon used to be.

## WHAT TO DO

Draw on the *Infant Moon: Moon Mix!* comic panel. Show, comic-book style, how different items separate in the bottle - just like the materials in the Moon's magma ocean!

## WHAT TO ASK...

Does your *Moon Mix!* bottle help you **imagine how the magma ocean separated**, with the top layer cooling to form light-grey rocks?
