

**Ages:**  
Grades 7 and up

**Duration:**  
45 minutes

**Materials:**

Per student

- one week's tide data
- one tide plotting graph
- a marker
- wall space for taping up the graphs

Per class

- Tape
- Optional: tides video

~ LPI EDUCATION/PUBLIC OUTREACH SCIENCE ACTIVITIES ~

## THE MOON'S RELATION TO OCEAN TIDES

Based upon the same activity by the Massachusetts Marine Educators at [http://www.massmarineeducators.org/activities/pdf/Ocean\\_Tides\\_MA\\_STDS.pdf](http://www.massmarineeducators.org/activities/pdf/Ocean_Tides_MA_STDS.pdf).

### OVERVIEW —

This activity is designed to show students the relationship between ocean tides and the lunar movements. It uses the tide data for Boston Harbor to show these relationships, but data from other sites can also be used.

### OBJECTIVE —

The students will:

- Plot high and low tide data for a week and combine their graph with others to observe long-term patterns
- Examine the data for extreme high and low tides and predict related lunar phases for those periods

### BEFORE YOU START:

*The students should be familiar with what tides are, the difference between tides and wave, and the concept of spring and neap tides.*

*Tide charts should be printed so that each student has the information for a single week to plot. The data supplied is for Boston Harbor but data is also available for other regions at <http://tidesandcurrents.noaa.gov/stations.html?type=Water+Levels>; only 1 month at a time is available and the details of the data can be confusing, but plots are also available.*

### ACTIVITY —

Invite the students to share their observations and experiences of tides—have any of them spent hours or days at the beach? Did they notice the water levels changing over time? Remind the students that tides are not simply waves, but the overall height of the water along the shore. Consider showing videos of changing tides.

Let the students know they will be graphing real tide data to see how tides change over time, and to determine the relationship between lunar phases and tides.

1. Hand out the tide data and a plotting graph—either one per student or (if preferred) you may want to let the students work in pairs.
2. Project an example of what a complete tide graph looks like, to help the students visualize and prepare for creating their graphs. Or you may wish to hold a class discussion on the types of graphs, the type of graph best for this data, the data ranges, etc.
3. Ask students to fill in the month, year, and dates at the top of the graph sheet, and to plot the tide points on the sheet.
4. After the tides are plotted, students should connect the points for high and low tides to make a line graph, ideally in thin marker so that it's easier to see the line from a distance.
5. Ask students to fold the right side of the paper up to the graph, so that no margin is showing, and to tape their sheet to the wall in order of the calendar so that their graph connects to the other graphs by date, overlapping on the margins.
6. Invite the class to examine the data and look for patterns. *What patterns do they see? Do the tides vary in a predictable way? What could be causing these changes?*
7. Discuss the influence of the Sun's and the Moon's gravitational pull on the Earth, and invite the class to determine when that combined pull will have the greatest and the least effect on the tides. The period where it has the greatest effect—when the high tides are highest and the low tides are lowest—is called *spring tides*. The period when it has the least effect is called *neap tides*.

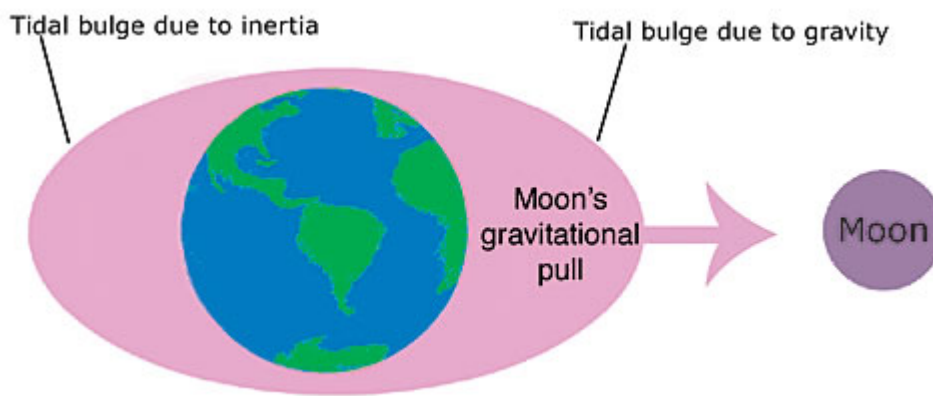

8. Invite the class to find points in the graphs which might be spring tides and points where it might be neap tides. Each page should have either a spring or neap tide for some date.
9. Have the class examine the dates of the Moon phases handout and compare them to the tide graphs. Ask the students to write down the Moon phases on the graphs, or post pictures of the phases above the graphs. *Are the full and new moon phases close to spring tides? Are the first and third quarter moon phases close to neap tides?*
10. Invite the students to share their explanations for the relationship between the lunar phases and the tides.

### BACKGROUND —

People who live along the ocean coasts often marvel at the changing tidal range on a daily basis. Along many coasts, there are two high tides and two low tides in an average 24 hour period. However, the geography of the land and sea floor and ocean currents can also have an effect on tides; the pattern of high and low tides along the coast for the Gulf of Mexico is very different from the pattern for the eastern shore of the United States.

The Moon's gravitational pull tugs on Earth — especially the portion that is nearest to it as it travels in orbit around Earth. Earth's crust rises slightly (several centimeters) due to this force. Ponds and lakes — such as the Great Lakes — experience small tides, as well. Earth's oceans, however, are free to lift many feet in response this tug. As the Moon orbits the Earth, it drags along behind it a "bulge" in the oceans.

If you've ever tried to push a stalled car in neutral from a dead stop, you've experienced the same force that counteracts the Moon's gravitational pull: inertia. On the side of Earth opposite the Moon, the universal tendency for objects to resist a change in its movement wins out over the gravitational pull. The ocean here can keep going in its original direction. Near the Moon, the oceans are pulled upward and along. Opposite the Moon, the oceans are "left behind."

*In this very, very exaggerated image of Earth's oceans from space, water bulges upward from the surface in two opposite locations on Earth's surface. Earth continues to spin, bringing different coastlines under the bulge throughout the course of a day. Most coastlines experience two tides each day as they pass through the two bulges.*  
 Credit: National Oceanic and Atmospheric Administration.

The Moon's contribution to Earth's tides is significant because it is so close. The Sun, of course, also exerts a gravitational pull on Earth — that's what keeps Earth in a steady orbit. Earth's oceans are pulled toward the Sun, but the Sun's gravitational pull contributes only about a third of the tides' height.

The height of the tides also depends on the distance between the Earth and the Moon on a given day. Because the Moon and Earth are not always the same distance apart, the tidal range changes daily.

When the Sun, Moon, and Earth are in alignment (at the time of the new or full moon), the gravitational pull of the Sun and Moon create extra-high high tides, and very low, low tides—"spring tides." One week later, when the Sun and Moon are at right angles to each other, the solar tide partially cancels out the lunar tide and produces moderate tides—"neap tides."

More information about tides is available from the National Oceanic and Atmospheric Administration at [http://oceanservice.noaa.gov/education/kits/tides/tides01\\_intro.html](http://oceanservice.noaa.gov/education/kits/tides/tides01_intro.html).

## ***TIES TO STANDARDS –NGSS***

### **Disciplinary Core Idea: MS-ESS1 Earth's Place in the Universe**

- MS-ESS1-1. Develop and use a model of the Earth-sun-moon system to describe the cyclic patterns of lunar phases, eclipses of the sun and moon, and seasons.
- MS-ESS1-2. Develop and use a model to describe the role of gravity in the motions within galaxies and the solar system.

### **Disciplinary Core Idea: MS-PS2 Motion and Stability: Forces and Interactions**

- MS-PS2-4. Construct and present arguments using evidence to support the claim that gravitational interactions are attractive and depend on the masses of interacting objects.

### **Science and Engineering Practices: Analyzing and Interpreting Data**

- Analyze and interpret data to determine similarities and differences in findings.
- Construct and interpret graphical displays of data to identify linear and nonlinear relationships.

### **Science and Engineering Practices: Constructing Explanations and Designing Solutions**

- Construct a scientific explanation based on valid and reliable evidence obtained from sources (including the students' own experiments) and the assumption that theories and laws that describe the natural world operate today as they did in the past and will continue to do so in the future.

### **Crosscutting Concepts: Patterns**

- Patterns can be used to identify cause-and-effect relationships. (MS-ESS1-1)
