Asteroids

Indian Springs School
Jack Markert, Swapnil Patel
Daniel Kang & Cheska Romero
Image 1 of Asteroid
Image 2 of Asteroid

- The surface of this asteroid is very smooth
- The holes in the shape of a snowman could have been formed by debris floating in space
- The darker and lighter parts represent different composition
- The scattered dots are from the debris hitting the asteroid over time
- Its rounded shape is formed by possibly hitting other asteroids
- The ridges on the tip of the asteroid are from a possible break away from another asteroid
- The bigger and smaller craters were probably formed from different sized debris
