

11/29/66

This ATM is a statement of the data subsystem test program presently being written for the DPS-2000 computer in the System Test Set. In general all processing is similar to that described in the following documents:

1. ATM 399B, section 2
2. SE 03 (formerly ATM 370)
3. ATM 547 data subsystem section

The program basically obtains mainframe sync, subframe sync (housekeeping incrementing sync pattern, 0-89), identifies mode ID, transmits commands both manually and automatically, verifies commands, transmits data to the experiment simulator and verifies data received for each experiment individually or any combination of experiments, tests housekeeping data against stored tolerances and/or previous data, and verifies the proper timing and incrementing sync pattern count occurrence corresponding to the frame mark pulse, even frame mark pulse, and ninetieth frame mark pulse.

The output from each area in the program is in real time on the MC-4000 line printer as follows:

The initialization of the program results in a printed comment, BEGIN DATA SUBSYSTEM TEST and TIME HH MM SS where HH equals hours 00-23, MM equals minutes 00-59, and SS equals seconds 00-59. Each occurrence of time print will appear in the HH MM SS format.

Mode identification is as follows for incrementing sync pattern (I. S. P) count 1-5 and subframe sync (two 90 mainframe passes in lock).

ID Bit= 1, ISP = 1	NORML	normal mode
ID Bit= 1, ISP= 2	SLOW	slow mode
ID Bit= 1, ISP = 3	STA A	station A
ID Bit= 1, ISP = 4	STA B	station B
ID Bit= 1, ISP = 5	STA C	station C
ID Bit= 1, ISP = 0, 6-89	IDERR	I. D. bit error

Command transmission is automatic from command list, or manual from external input from the System Test Set (STS). Manual/automatic mode is selected by sense switch setting. Upon command transmission in either mode, the following will be printed:

```

XM$0123 HH MM SS
XM transmission
$0123 command transmitted
HH MM SS time
$ = OCTAL NUMBER IN ALL CASES

```

Command verification word is printed whenever CV≠0. When CV≠0, it is compared to the last transmission and outputted as follows:

11/29/66

- CV \$ 0123 normal CV word received and compared to last transmission with parity bit true.
- PCV 000 indicates parity error.
- CV \$ 0123 NX normal received as above, no transmission
- CV \$ 0122 ER \$ 0123 received CV, compare ≠ to last transmission, therefore, print last command transmitted.

For a valid CV word, housekeeping data will be printed for the next ninety house-keeping words. Automatic command transmission will be inhibited during this time and normal manual transmission will be inhibited. Sense switch override is provided for immediate manual transmission.

Transmission of data is continuous for all experiments during the running of the program. Sense switch selection determines which experiment data will be compared to data transmissions. Upon an incorrect comparison of received data with transmitted data, outputs are as follows:

PS20 T\$0363 R\$0362

- PS - Passive Seismic
- MG - Magnetometer, etc.
- 20 - mainframe word number
- T\$0363 - transmitted pattern
- R\$0362 - received pattern

The central station housekeeping (HK) section has the facility (using sense switches) for continuous output. In the continuous mode all HK data is printed on the line printer. When not in continuous mode and in subframe lock (after two complete cycles of 90 mainframes), HK data will be printed when it is out of tolerance, when a change from its previous value is detected, or when the data is to be printed each time it is received (no tolerance). The first 90 HK words received after an uplink command is transmitted and verification is received will be printed. Sense switch control is provided for the experimenter to turn on HK data if desired. When HK data is printed, it is identified with the code "HK" followed by the subframe word number (0-89). The data is printed in octal form and may be followed by diagnostic letter or symbolic codes indicating the reason for printing.

- Codes:
- C = continuous mode
 - OT = out of tolerance
 - * = change from previous value
 - I = initial pass of HK data

Frame mark, even frame mark, and ninetieth frame mark are checked for proper

Data Subsystem Programming
for DPS 2000 (System Test Set)

ATM 583

occurrence as to the ISP count and timing. The following diagnostics will be printed:

FMTE	frame mark timing error
EMTE	even frame mark timing error
NMTE	ninetieth frame mark timing error
FMER	frame mark occurrence error
EMER	even frame mark occurrence error
NMER	ninetieth frame mark occurrence error

The accompanying functional flow chart is intended only to provide interested parties with an outline of program flow. As program debugging progresses, detailed flow charts just above the coding level will be drawn. These charts and annotated assembly listings will be appended to this document when they are available.

Sub Routines

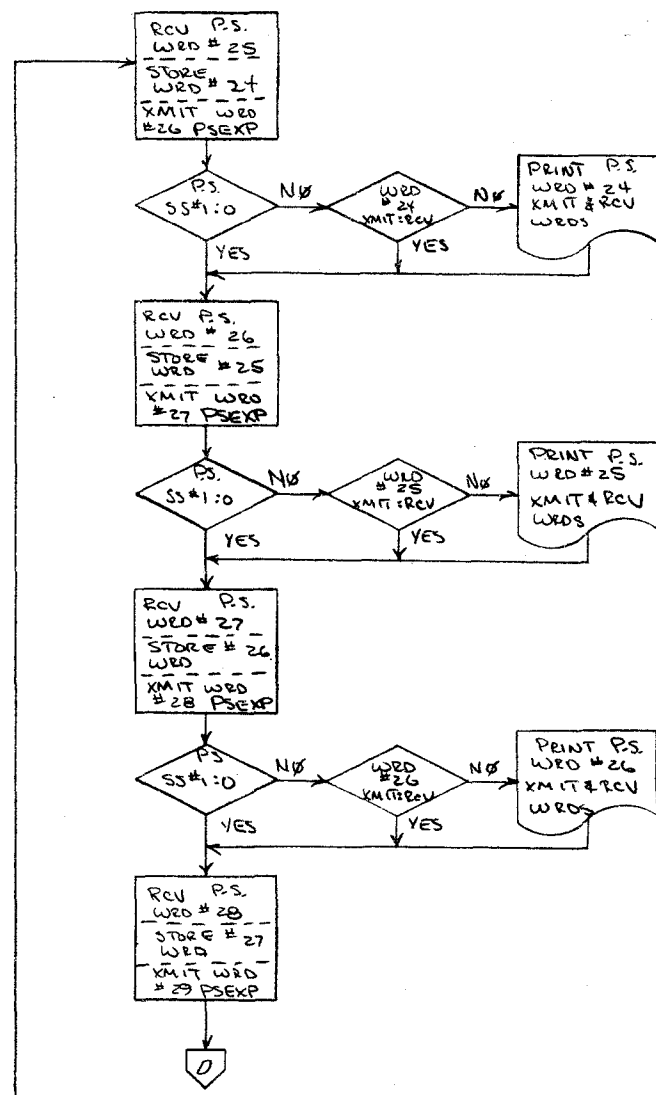

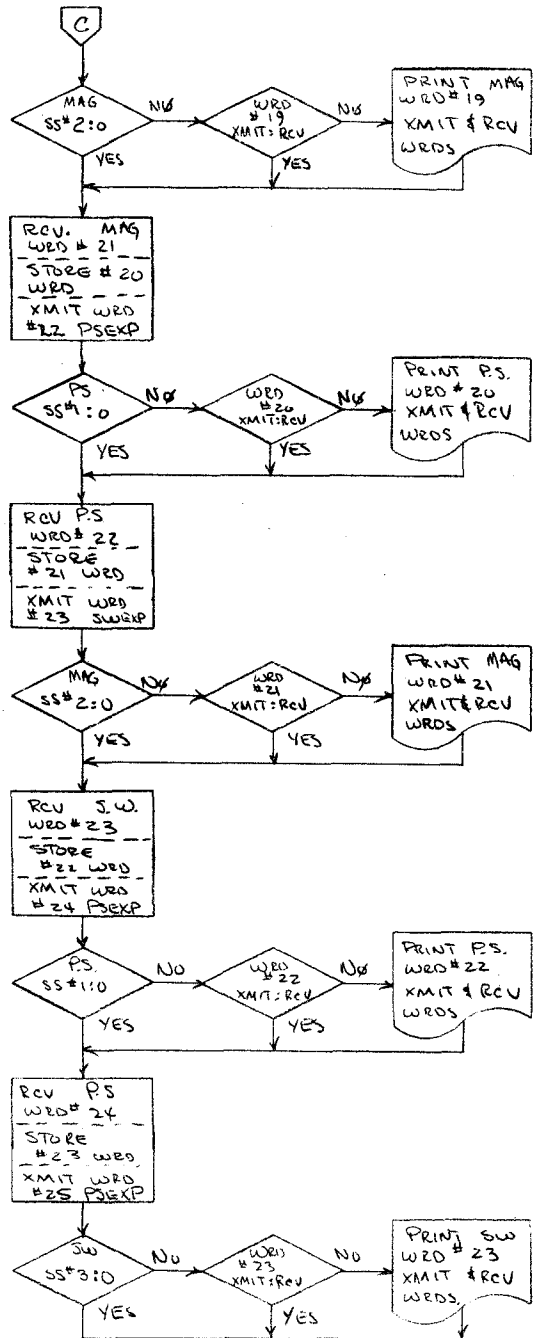

EXECQ - supervisor
START - print comments
RESTART - print comments
INIALIZE - reset all flags
HKSUB - housekeeping
CVSVB - command verify
ISPSF - ISP sync acquisition
SISUB - 3 } SIDE exit modified
= FMTST } test frame mark timing
MFRTN - recycle sync
FMEST - test frame mark occurrence
XCSub - transmit command
IDSub - mode identification
PSSUB - passive seismic
MGSUB - magnetometer
SWSUB - solar wind
SISUB - SIDE
