## INTRODUCTION

The normal operation of PSEP when deployed on the lunar surface is very similar to that described for ALSEP (with PSE the only active experiment) in ATR-31. This memorandum provides revised planning—information on the special activities necessary to prepare PSEP for flight, to initiate lunar operation and to establish the proper conditions for lunar night survival and subsequent re-initiation.

## PSEP PRE-FLIGHT MODE

As installed in the LM SEQ bay, PSEP shall be in a functional mode (non-operating, of course) defined by the pre-set selections listed in Table I. The back-up timer will be started before shipment from the factory. The PSE will be prepared for service by cutting the Sensor Enclosure Tube in the ALSEP Launch Preparatory Site (ALPS) and by removing the Uncage Plug during assembly into the SEQ bay.

## FIRST LUNAR DAY INITIAL OPERATION

As soon as the east side of the solar array is fully deployed (and assuming that the astronaut does not stand or walk so as to shadow the panels) there will be adequate power to immediately activate PSEP. Since the antenna alignment is the final crew task before leaving PSEP, determination of down-link operation should be possible almost immediately.

At the first opportunity before Ascent Stage take-off which is consistent with the Apollo communications requirements, the transmitted telemetry data shall be evaluated with particular attention to power balance and central station temperatures. The PSE thermal control shall be turned off. Any contingency action indicated by this evaluation shall be taken immediately (assuming availability of the MSFN command link).

To initiate PSE operation, it remains to turn the PSE operational power ON, uncage and level the sensor as detailed in the ALSEP Operations Plan (ATR-31).

## FIRST DAY SYSTEM SHUT DOWN

To prepare PSEP for survival during the lunar night, the following shut-down sequence will be implemented.

1. As reserve power decreases at the end of the lunar day to 2 to 3 watts command the PSE to Standby ON (octal command 037) and verify that it was executed.

TABLE 1

STATUS OF SELECTABLE MODES DURING FLIGHT

<u>Equipment</u>	<u>Function</u>	<u>*Flight Status and/or Command</u>
<u>Power Subsystem</u>		
PCU	Redundant Channels	PC 1 SEL (060)
<u>Data Subsystem</u>		
PCU	Experiment Power	EXP 1 STBY SEL (037)
	Redundant Transmitters	XMTR A SEL (012)
	Transmitter Power	XMTR ON (013)
	Fixed Electrical Loads	DISSIP R1 OFF (021) DISSIP R2 OFF (023)
	Redundant Data Processors	DDS/PROC X SEL (034)
Data Processor	Data Rate	NORM BIT RT (011)
Command Decoder	Timer Output	TIMER OUTPUT ACCPT (032)
Passive Seismic Exper.	Long Period Gain (X), (Y), (Z)	-30 db (063 & 064)
	Short Period Gain (Z)	-30 db (067)
	Leveling Direction	LVL DIR POS (074)
	Leveling Speed	LVL SPEED LO (075)
	Leveling Mode	AUTO (103)
	Coarse Level Sensor	LVL SENSOR OUT (102)
	Leveling Power (X), (Y), (Z)	OFF (070, 071, 072)
	Thermal Control Mode	AUTO ON (076)
	Calibration (SP)	OFF (065)
	Calibration (LP)	OFF (066)
	Filter	PSE FILT OUT (101)
	Seismic Sensors	Caged ( — )
<u>Dust Detector</u>	**Operating Power	ON (027)

\* For nomenclature see Appendix A.

\* Since Dust Detector power is controlled by an electronic flip-flop the selection state upon initial PSEP power ON cannot be predicted.

2. Command PCU into PC 2 mode (octal command 062) and verify that the transition was made successfully.
3. When reserve power reaches approximately 1 watt command the transmitter power OFF (octal command 014).

SECOND LUNAR DAY INITIAL OPERATION

No commands should be sent to PSEP during the first 24 hours following lunar sunrise at the PSE location. It is estimated that the average thermal plate temperature will rise above the minimum operating temperature of  $-10^{\circ}\text{F}$  during this 24 hour period.

1. At the proper time command the transmitter ON (octal command 013).
2. If link is not established, command the transmitter power OFF (014), wait several hours and then repeat step 1. If link is established, evaluate the housekeeping data.
3. Command PSE power ON (octal command 036).
4. When real-time data monitoring is no longer desired, an engineering evaluation of operational status should be made to determine the merit (if any) in returning the PCU to PC 1 operational mode.
