PREFACE

The objective of program documentation is to provide the means for documenting an equipment design by defining performance, configuration, interfaces, operation, maintenance, etc. As such, the program documentation forms the basic media of communication between personnel engaged in research, development, and design, and the personnel responsible for procurement, production, inspection, maintenance, and related logistic functions. It is the purpose of the discussion in this technical memorandum to establish a perspective and to motivate some thought on the documentation requirements for space flight scientific experiment programs from a cost effective viewpoint.

Cost effective program documentation requirements are not easily developed for a complex program as in the example of the Apollo Lunar Surface Experiments Package (ALSEP) for the Apollo program. The documentation requirements for ALSEP are discussed and compared to ASTP program requirements in the report and are presented as the basis for the formulation of recommendations for documentation requirements for future scientific experiment programs.

DATE	4-14-75

1. OBJECTIVE

The objective of this technical memorandum is to provide cost effective documentation recommendations for future NASA Space Experiment Programs based on previous ALSEP, Viking, and Rocket Payload requirements.

2. METHODOLOGY

To attain this objective, this technical memorandum presents:

- a. A review of documentation requirements and the document data produced for ALSEP Array E.
- b. A matrix of all pertinent documentation by individual program area.
- c. A functional/value effectiveness evaluation of document types.
- d. Recommendations for cost effective baseline documentation and alternate approaches for subsequent NASA Science Payloads and Experiments.
- e. A documentation guideline exhibit to satisfy space experiment program requirements for performance, reliability, and safety.

3. DOCUMENTATION CLASSIFICATION

The documentation required by contract for the ALSEP program was divided into categories by type:

Type I - Data requiring NASA written approval prior to implementation.

Type II - Data submitted to NASA for coordination, surveillance, information, review and/or management control.

Type III - Data retained by contractor to be made available to NASA upon request.

Other - Documentation required for internal information and reporting not specified by contract.

PAGE <u>4</u>	OF <u> </u>
DATE 4-14-75	

4. DOCUMENTATION COST DRIVERS

Various factors tend to increase the cost of program documentation. The factors of primary concern during this study were:

- a. Large number and variety of documents for all program areas.
- b. Formality of documentation classification, i.e., Type I, Type II, or Type III.
- c. Approval requirements for generated documents.
- d. Frequency of submittals.
- e. Number of copies and resultant reviewing groups inputs and changes.
- f. Number of documentation updates.

5. DOCUMENTATION REVIEW

The documentation requirements and submission schedule for the ALSEP Array E program is presented in Appendix A. Each area of the documentation requirements was reviewed to determine the types of documents produced.

A matrix of all pertinent documentation by individual program area was generated as a result of this review and is presented in Appendix B. This matrix includes an assessment of function/cost effectiveness and recommendations for alternate approaches for subsequent NASA Science Payloads and Experiments.

5.1 PROGRAM MANAGEMENT

Management control documents are the top level basis management documents which describe the overall plan for implementing and administering the program. The ALSEP program was managed using an integrated set of Management Control Plans (MCP's) and Functional Plans combined with a Work Breakdown Structure (WBS) and multi-tier hardware schedules.

**Space
Systems Division**

Documentation Requirements for
Space Experiment System Programs

NO.	REV. NO.
ASTIR #25	A
PAGE 5	OF
DATE 4-14-75	

The overall Management Control Plan (MCP) was generated as a proposal item and negotiated into the contract, originally and for each major revision of the ALSEP contract. For the system and each individual experiment, the primary MCP areas were:

Program Control
Engineering
Crew Engineering
Configuration Control
Reliability
Manufacturing
Testing
Quality Assurance
Logistics
Training
Field Support
Procurement

Costs controls were organized to define and control costs for each of the MCP areas, which were also divided for hardware costing to reflect the primary hardware areas of the WBS at Tier I and Tier II levels.

Configuration Management, Reliability, Quality and Safety Program plans were also prepared to further detail scope and method in accordance with planning requirements set forth in NASA program standards.

The ALSEP program used Program Directives, Engineering Directives, Manufacturing Directives, Test Directives and Quality Directives to coordinate the management of program functions between two or more separate organization groups as needed to accomplish program requirements on a timely and efficient basis. These directives replace or supplement functional program plans and may invoke or define

Space Experiment System Programs

NO.	REV. NO.
ASTIR #25	A
PAGE 6	OF
DATE 4-14-75	

procedures and processes in the same manner as functional plans. In combination with MCP task statements, directives may fully replace functional plans and be very specific and effective for each individual project or program.

5.2 SYSTEM AND DESIGN ENGINEERING DOCUMENTATION

System and design engineering documentation provide the means for documenting an engineering design by defining performance, configuration, interfaces, operation, etc. These documents form the basic media of communication between personnel engaged in research, development, and design and personnel responsible for procurement, production, inspection, maintenance, and related logistic support functions. Specific documents are listed in the System and Design Engineering section of the Documentation Matrix in Appendix B.

Figure 5.1 illustrates over 90 specifications which were delineated at the start of the Array A Program. The LRRR and Array E experiments added another dozen equipment and interface specifications. Therefore, over 100 equipment and interface specifications were maintained during the program.

Content and format of the subject specifications adhered to the requirements set forth in NASA publication NPC 500-1 (replaced later by the equivalent NASA publication NHB 8040.2). In addition to the flight and GSE hardware specifications for ALSEP, the contractor was responsible for documenting all functional, procedural and hardware interfaces, e.g.,

The interfaces between subsystems,
Test equipment interfaces,
Manned space flight network (MSFN),
The GFE supplied to contractor, and
The crew interfaces.

For specifications, MIL-STD-490 format guidelines for a simple 6 part specification should be used in lieu of NPC 500-1, NHB 8040.2 or contractor procedures (e.g. failure reporting, MRB activity, fault tree analysis, etc.).

At the piece parts level, the contractor was required to use NASA preferred parts wherever feasible based on a reliability-oriented "Order of Precedence." When new specifications were needed to add part screening, burn-in or other controls to satisfy space program requirements, the contractor was required to write, negotiate and issue piece part specifications equivalent to those in the NASA preferred parts lists. There were more than 200 new user-controlled specs (SCD's) required for ALSEP; 122 of these were used on Array E and they are listed in "Table 5.1." A good number of the new part specifications were required for the LSG and other experiments where the PI could not allow part type substitutions of similar parts from the NASA or other Hi-Rel preferred part lists.

Specification/Source Control Drawings (or documents) need not follow general government standards if "User Specifications" may be jointly negotiated with suppliers to limit key physical, functional, test and traceability requirements of piece parts or components (rather than to document the typical spectrums of requirements applicable to piece part standards).

There were from 12,000 to 14,000 drawings released for each ALSEP array. All ALSEP drawings were prepared to meet the contractor's drawing system requirements for deliverable hardware, i.e., Class B drawings which conform to high but cost effective professional standards. Equivalent standards were imposed on subcontractors and suppliers having design responsibility.

ALSEP Technical Memoranda (ATM's) were defined by ALSEP program directive as the primary means for documenting engineering analyses and reports not explicitly covered by other NASA requirements. Over 1100 such documents were generated during the program (153 of which were prepared for Array E alone). As shown in Table 5.2 the Array E ATM's covered weight and power budgets, stress analysis performed in response to design review action items, scheduled and unscheduled reliability analysis, requirement analysis studies, etc.

There is no doubt that the ATM served as a useful and flexible means for issuing all sorts of technical data using an organized distribution system. The extensive contractor and government distribution list was costly to implement, where essentially all documents on all matters

were issued to a complete distribution list, e.g., each PI desired all system ATMS and those on all experiments other than his own. Full distribution of ATM logs should allow recipients to review each ATM topic and request only those items he knows will be of interest to him.

5.3 CONFIGURATION MANAGEMENT

Configuration control, the processing of drawing changes, specification changes, etc., was based on the use of the existing contractor's configuration management procedures which met the intent of NASA regarding design baseline configuration accounting and change control.

Change Board Membership, approval signatures required for various types of drawings, etc., was established and maintained via contractor program directives coordinated with contractor in-house policies and procedures.

PDR and CDR scheduling for ALSEP was determined by program management and supported by configuration control as appropriate.

5.4 SYSTEM TEST

Test Procedures, Types I and II for ALSEP consisted of dozens of documents generated for each type of functional or environmental test performed at component, integration system and end-item levels of assembly, during separate stowage mission modes, with variation procedure documents for MSFN test, KSC operational check, etc. The rather large variety of customer controlled tests and individual test-unique test procedures results in a costly test document program, justified only by man-rated safety programs, but not by Experimenters. Therefore it is suggested that emphasis be placed on meeting the experiment end item requirements in customer approved procedures and reduction in the number of formally controlled procedures and reports to those which deal with end item testing.

5.5 RELIABILITY AND QUALITY ASSURANCE

Quality Assurance activities which include Quality Engineering, Inspection, Testing, etc. was based on existing contractor's quality

**Aerospace
Systems Division**

**Documentation Requirements for
Space Experiment System Programs**

NO.	REV. NO.
ASTIR #25	A
PAGE 18	OF
DATE 4-14-75	

assurance procedures which met the intent of NASA requirements. The reliability program was conducted in accordance with the Reliability Program Plan developed to respond to NASA requirements as specified in the contract. Specific Reliability and Quality Assurance documentation and recommendations for future programs are included in the Reliability and Quality Assurance section of Appendix B.

5.6 SYSTEM SUPPORT/LOGISTICS

The System Support and Logistics activities were tailored to meet NASA requirements as specified in the contract in the areas of Launch Complex Operations, Safety, Training, Human Factors, Maintenance, Spares, Launch Complex Quality Programs, etc.

In areas such as familiarization manuals and maintenance manuals documentation costs can vary widely depending on their depth. Scope limited to external features, input/output functions and external test interfaces minimizes user cost and complexity. Recoverable or non-recoverable hardware may be maintained at the end-item level which is generally more efficient for both the user and the supply contractor (who will perform lower-level maintenance.)

5.7 MANUFACTURING

Manufacturing documentation consisted of a Manufacturing Program Plan, Schedules, Make or Buy Plan, Processes (existing contractor processes where applicable), Work Order Operation Sheets (WOOS), Workmanship Standards, and Tool Drawings. Documentation cost reduction in this area could best be achieved through the reduction of the number of separate documents to be maintained, reducing all document classification to Type III, and using existing contractor procedures to the maximum extent possible.

6. DOCUMENTATION VALUE ASSESSMENT

Appendix B presents a matrix evaluation of ALSEP documentation. Of the 81 line items, 48 or 59% of them are Type I and Type II which require approval/disapproval action.

**Aerospace
Systems Division**

**Documentation Requirements for
Space Experiment System Programs**

NO.	REV. NO.
ASTIR #25	A
PAGE <u>19</u> OF <u> </u>	
DATE <u>4-14-75</u>	

It would seem advisable to eliminate most Type I documents by negotiating the baseline equivalent during contract negotiation, all subsequent changes would be processed through contract change channels which can fully evaluate and control delta costs.

Objective Accomplishment, Relative Cost, Program Impact and Justified Cost/Result columns in the Table score effectiveness in these areas on a basis of one-to-ten, from low to highly effective.

Items which are scored as low as 7 or 8 in the "Justified Cost/Result" column generally may be replaced by lower-cost alternate concepts or eliminated. Requirements for the lower cost alternates should be reduced to meet program intent for each contract; established government standards should only represent a guideline.

7. SUMMARY AND RECOMMENDATIONS

To realize a documentation cost reduction for a space experiment systems program it is necessary to minimize cost drivers while maintaining sufficient requirements to assure hardware performance, reliability, and safety. This can be achieved by the systematic application of the following actions:

- a. Reduce, to the maximum extent possible, the number and variety of documents for all program areas.
- b. Limit the number of Type I and Type II, requiring approval/disapproval action.
- c. Reduce frequency of document submittals.
- d. Limit distribution lists to those areas where the document is needed.
- e. Reduce the number of document updates.
- f. Utilize a lower cost alternate document for the high cost item where possible.

PAGE 20	OF
DATE 4-14-75	

Appendix B summarizes the documentation reviewed and presents recommendations for future space experiment applicability and lower cost alternate documentation items. The rationale for the recommendation is included in the remarks column.

Appendix C was prepared for use as a guideline to a cost effective payload experiment documentation which can still satisfy the intent of NASA requirements for performance, reliability, and safety.

EXHIBIT C

DOCUMENTATION REQUIREMENTS

1.0 GENERAL

The documentation requirements defined in this Exhibit indicate the scope of documentation effort of this contract. Specific documentation delivery requirements are presented in Schedule III attached.

The documentation requirements specified shall not be altered as a result of a make-or-buy decision, e.g., the contractor shall be responsible for the items he makes as well as those he buys. A conflict exists between the requirements of this document and the referenced specifications or documents, the requirements of this Exhibit apply.

1.1 CLASSIFICATION

Data required shall be of three categories. Type I shall be submitted to NASA for approval. Implementation of Type I documentation shall not proceed until after: (1) approval by NASA, or (2) until 7 days after receipt by NASA for procedures and 20 days for reports and plans. NASA approval is considered to be granted if the contractor has not received written notice of disapproval and identification of specific deficiencies within 7 days for procedures and 20 days for reports and plans. Type II data shall be submitted for coordination, surveillance, information, review and/or management control. Type III data shall be retained by the contractor and submitted to NASA only upon request. Insofar as practicable, the contractor's own internal documents shall not be retyped and duplicated on more expensive paper prior to submission.

1.2 DATA IDENTIFICATION

All contractor documentation shall be organized into a series of numbered documents. All documents delivered, except drawings, shall be clearly marked with the paragraph number which requires such delivery. Type I documents shall be clearly marked "Preliminary - NASA Approval Pending" or "Approved by NASA" as

**Aerospace
Systems Division**

Documentation Requirements for
Space Experiment System Programs

ASTIR #25	A
PAGE <u>43</u> OF <u> </u>	
DATE 4-14-75	

appropriate. The number of copies required will be one reproducible copy for all Type I and II documents except punch cards, tapes, and drawings, plus two additional copies unless otherwise noted in Schedule III.

1.3 REVISIONS, AMENDMENTS, AND ADDITIONS

In preparing Type I and Type II documentation which will require periodic revision, the contractor shall prepare initial documentation using a refastening method so that pages may be deleted and/or inserted. When the original document is so prepared, the contractor need not submit the entire document but shall submit revised, amended or additional pages as appropriate. Accompanying these pages will be an instruction page detailing the exact means for effecting the revision or amendment. The provision of this paragraph does not apply to specifications, drawings, etc., which have an established procedure for the processing of amendments and revisions.

2.0 APPLICABLE DOCUMENTS

Documents referenced in this exhibit are of the issue in effect on the date of contract effectivity and form a part of this exhibit to the extent specified herein.

3.0 MANAGEMENT DOCUMENTS

Management documents are to be top level documents which consist of the Management Control Plans and Function Plans. The plan shall detail the tasks by which the contractor intends to comply with the statement of work. The plan shall include master phasing charts and milestone charts for the overall program.

3.1 MANAGEMENT CONTROL PLANS

The documents shall consist of a series of plans, the total of which amounts for the activities of the contractor, subcontractor, and personnel on the program.

**Aerospace
Systems Division**

Documentation Requirements for
Space Experiment System Programs

NO.	REV. NO.
ASTIR #25	A
PAGE 44	OF
DATE 4-14-75	

3.1.1 Financial Management Reports

A contractor Financial Management Report (NASA Form 533) shall be prepared each month.

3.1.2 Monthly Letter Progress Report

A monthly summary of schedule significant program progress and tasks shall be prepared.

3.2 COST PROPOSAL

The contractor shall prepare an integrated cost proposal for the implementation of this program and any modification thereto. The cost proposal shall be divided into the same organization units as the Management Control Plans and shall comply with standard Government policy.

4.0 FUNCTIONAL PLANS

4.1 INTEGRATED TEST PLAN

This document shall describe the hardware Qualification Test Program and the Flight Acceptance Test Program and shall be submitted in accordance with Schedule III.

4.2 RELIABILITY PLAN

Task statements included in the Management Control Plan:

4.2.1 Failure Reports on Qualification and Flight Models Shall Consist of:

- (a) TWX notification to NASA
- (b) Analysis and corrective action on non-GFE items.

4.2.2 Approved Materials List

The contractor and suppliers shall select parts, devices and materials for the contract hardware on the basis of suitability for their application(s). Initial selections may be based on good performance in

**Aerospace
 Systems Division**

Documentation Requirements for
Space Experiment System Programs

NO.	REV. NO.
ASTIR #25	A
PAGE 45	OF
DATE 4-14-75	

prior comparable uses or its presence on an existing list, whether NASA-furnished or from another source. Whenever practicable, items selected shall be already qualified to pertinent specifications, and selection shall minimize the number of stypes of each generic type. When selecting items previously qualified, the contractor shall devote particular attention to currentness of data, applicability of basis of qualification and adequacy of specifications. The contractor and suppliers shall prepare and maintain project parts, devices, and materials lists for use in design of the contract hardware. Because these items are a limiting factor on the reliability of the design and hardware, every effort shall be made to select all necessary parts, devices, and materials as early in the project life as possible. The project lists should be complete (with the exception of a few items) and be submitted to the procuring NASA installation prior to detailed design of the hardware. After initial submittal, Contractor parts/devices/materials lists shall be updated and submitted as specified in the contract.

4.3 QUALITY PLAN

Shall be defined in the basic contract and MCP tasks.

4.4 CONFIGURATION MANAGEMENT PLAN

Configuration Management as provided in the MCP tasks shall be implemented under this program.

5.0 SPECIFICATIONS

5.1 CFE SPECIFICATIONS

Using 6-section MIL-STD format as a guide, the contractor shall prepare CFE specifications for his hardware at the deliverable end item level. Equipment Specifications shall specify the detailed requirements of the particular equipment, identify the subsystem of which it is a part, and specify the quality and acceptance provisions designed to show that the requirements have been fulfilled.

**Space
Systems Division**

Documentation Requirements for
Space Systems

NO.	REV. NO.
ASTIR #25	A
PAGE 46	OF
DATE 4-14-75	

5.1.1 Interface Documentation

The preparation of interface documentation shall be the responsibility of the contractor. The contractor or other representative who is to provide the equipment on behalf of the Government shall co-sign the interface documentation prior to its submittal to NASA/MSC for approval. Interface differences between participants shall be resolved by NASA/MSC.

5.2 END ITEM SPECIFICATION

The contractor shall prepare specifications defining the technical requirements. In general, these specifications shall define such areas as functions, performance, design, configuration, interface, qualification, reliability and acceptance requirements for the module to be delivered.

5.3 TEST PROCEDURES AND SPECIFICATIONS

Test procedures shall be prepared for qualification and flight acceptance tests and will be utilized by test personnel to conduct such tests. As such, they will describe the step-by-step activities to be performed during the test operations. The activities will be listed in the sequence in which they are to be performed and keyed to a specific time reference. All safety or emergency procedures will be detailed for each hazardous condition.

5.3.1 Quality Test and Inspection Procedures

The contractor shall prepare test and inspection procedures in accordance with contractor standards for good practices.

5.3.2 Process Control Procedures

The contractor shall provide process control procedures in accordance with contractor standards for good practice.

**Aerospace
Systems Division**

Documentation Requirements for
Space Experiment System Programs

NO.	REV. NO.
ASTIR #25	A
PAGE 47	OF
DATE 4-14-75	

5.3.3 Recommended Storage Procedures for End Items

The contractor shall provide adequate storage procedures. These procedures shall assure suitable protection against deterioration and damage for both short term and long term (in excess of two years) storage periods. Special handling and preventive maintenance considerations shall be included as necessary.

5.4 SYSTEM QUALIFICATION TEST REPORT

The contractor shall prepare a Qualification Test Report covering all such tests defined by the program.

5.5 FLIGHT ACCEPTANCE TEST REPORT

The contractor shall prepare a Flight Acceptance Test Report consisting of the following:

- 1) Pre-test meeting minutes (if applicable)
- 2) As-run procedure including DR's
- 3) Post test meeting minutes (if applicable)
- 4) Documentation of closing action items status.

6.0 ENGINEERING REPORTS AND DATA

6.1 TECHNICAL DATA, REPORTS AND ANALYSES

The contractor shall prepare technical reports which describe the studies, analyses, and results of the contractual effort. The reports shall be prepared at times when complete blocks of work have been accomplished, and if appropriate, as logical subdivisions thereof. Major technical areas shall not be combined in a single document, but shall be published individually. Format is contractors option.

6.2 DESIGN INFORMATION

The contractor shall submit preliminary design information to assist in expediting the interchange of design data and to keep NASA continually and currently apprised of the contractor's activities, philosophy, approaches, solutions, and design evaluations. See 6.1 for data media.

**Space
Systems Division**

Documentation Requirements for
Space Experiment System Programs

NO.	REV. NO.
ASTIR #25	A
PAGE 48	OF
DATE 4-14-75	

6.2.1 Design Review Minutes

Minutes shall be prepared of the results of the Design Review. Action items incorporated shall include schedule dates.

6.3 SUBCONTRACTOR DRAWINGS AND ENGINEERING ORDERS

The contractor shall maintain a complete, up-to-date set of all drawings sufficient to describe each of the equipments, including those of his vendors, for which he is responsible. The contractor drawings shall be Type III. Drawings of non-deliverable modules or in-house equipment such as mockups, etc., shall be type III. These drawings shall be prepared using the contractor's internal drawing system, and shall conform to high professional standards.

6.4 SPECIFICATIONS/SOURCE CONTROL DRAWINGS

Contractor procured hardware shall not require submission of engineering drawings for suppliers. The contractor, in order to exercise control of suppliers, will prepare specification/source control drawings, as applicable, and will make these documents available to NASA upon request.

7.0 OTHER DOCUMENTATION

7.1 OPERATIONAL DATA BOOK INPUT

A Spacecraft Operational Data Book addendum shall be written and prepared to define configuration, operational data, system constraints and limitations and system command descriptions. This Type I data will be published and distributed by NASA for use in lunar operations. Inputs supplied by the Contractor will be published and distributed by NASA.

7.2 CONTRACTOR'S PARTS LIST

The contractor shall prepare a list of parts and materials selected and submit these data to scheduled design reviews.

**Aerospace
Systems Division**

Documentation Requirements for
Space Experiment System Programs

NO.	REV. NO.
ASTIR #25	A
PAGE 49	OF
DATE 4-14-75	

7.3 MINUTES OF MEETINGS

Meetings - NASA shall be notified 3 days in advance of meetings with other contractors, government agencies, and participants in the Program. Minutes (including all agreements and action items) of meetings shall be written by the contractor and the draft signed by representatives of the organizations involved prior to departure of the meeting parties. The minutes shall be typed and forwarded to all attendees and various designated NASA addresses.

7.4 MEASUREMENTS REQUIREMENTS DOCUMENT

Provide NASA data survey parameters applicable to each measurement point in tabular form to permit evaluation of the validity of each measurement.

7.5 GROUND SAFETY PLAN

The Ground Safety Plan shall include the purpose and description of the hardware. It shall include details of equipment design with special emphasis on the safety features. It shall also describe ordnance items, technical data sheets, and the KSC flight systems operations and safety management program precautions which apply.

7.6 OPERATIONS PLAN INPUT DATA

The Operations data shall define the operating sequences for the operational hardware. It shall contain the time lines for each experiment turn-on, and operations procedures. The operations data provides the guidelines for the development of the Science Operation Support Plan.

7.7 OPERATIONS HAZARD ANALYSIS

The details of the report shall be consistent with the complexity and inherent hazard potential of the hardware during test, checkout, and support for maintenance, training, simulation, and operations.
