14006

Crystalline-matrix Breccia

12.13 grams

Figure 1: Photo of 14006. Sample is 3 cm acros NASA S71-25296.

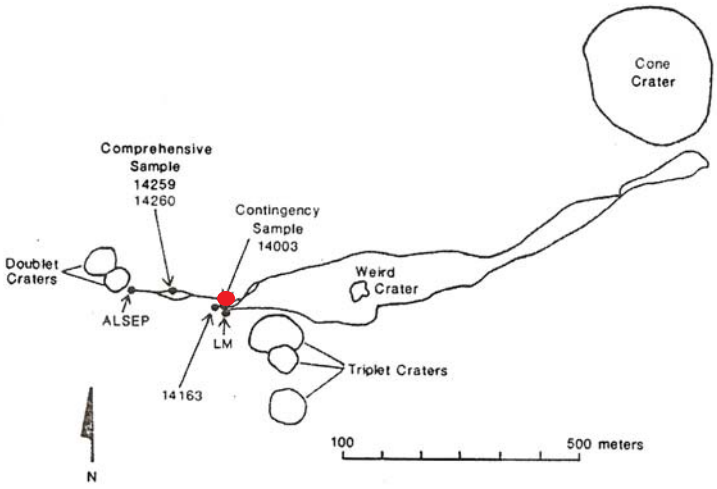

Figure 2: Map of Apollo 14 showing location of "contingency sample".

Introduction

14006 is a greater than 1 cm rock chip sieved from the contingency sample (figure 1). It is a breccia sample of the Fra Mauro type.

Records show that Larry Nyquist was the consortia chief for this rock.

Petrography

Phinney et al. (1976) described 14006 as a tough, crystalline breccia with 15-20% vugs and vesicles. The matrix is fine-grained with intergrown plagioclase, cliopyroxene and ilmenite. Carlson and Kramer (1978) note that not all thin sections are alike, and that there is at least some glass. Simonds et al. (1977) found that most clasts in 14006 were mineral clasts (figure 6).

McKay et al. (1972) studied some of the vapor phase deposits in the vugs of 14006.

Chemistry

14006 has a composition typical of the crystalline-matrix breccias from Apollo 14 (figures 4 and 5).

Other Studies

Bogard and Nyquist (1972) determined the abundance and isotopic composition of rare gases in 14006. Dran et al. (1972) determined the density of cosmic ray tracks.
