15610, 15633, 15641, 15643 and 15663

Coarse Olivine-normative Basalt

1.5, 7.4, 6.9, 17.9 and 10.5 grams

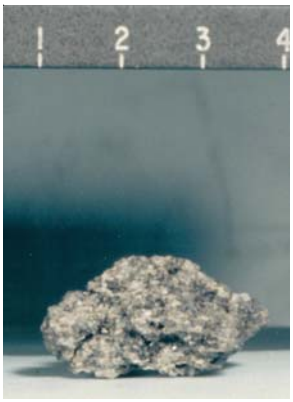

Figure 1: Photo of 15633. Scale is in cm. S71-49291.

Figure 2: Photo of 15641. Cube is 1 cm. S71-49555.

Figure 3: Photo of 15643. Cube is 1 cm. S71-49783.

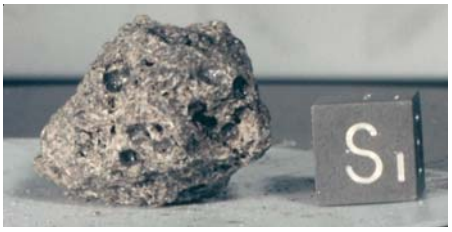

Figure 4: Photo of 15663. Cube is 1 cm. S71-49717.

Introduction

These small samples of coarse mare basalt were collected from near the Hadley Rille at station 9a. 15610 is a "walnut" (>1 cm) from the large 15600 soil, while the other particles are rake samples from an adjacent area. There is evidence for olivine addition/ subtraction to the liquid composition (see section on 15614).

15663 was dated at 3.26 b.y.

Petrography

Rake fragments 15610, 15633, 15641, 15643 and 15663 are grouped together because they are *relatively* coarse-grained samples of the abundant olivine-normative Apollo 15 basalt clan (typical example 15546). *However, "coarse" may not be the appropriate word, because their average grain size is only about 1 mm.*

Most olivine grains are less than 1 mm; the larger ones contain silicate melt inclusions. Pyroxene grains are up to 2 mm and somewhat elongate. They are chemically zoned from pigeonite to Fe-rich augite. Plagioclase grains up to 3 mm, poikilitically enclose small pyroxene, otherwise intergrown with pyroxene. Chromite is found in pyroxene and is overgrown with

Mineralogical Mode

	15610	15633	15641	15643	15663
Olivine	13 %	18	17	13	8
Pyroxene	51	52	52	60	58
Plagioclase	25	21	26	21	27
Opaques	8	6	6	4	6
Silica	0.6	1	0.3	0.5	1
Meostasis	2.4	2	0.7	1.5

ulvospinel when it is interstitial. Minor phases include cristobalite, fayalite, ilmenite, troilite, Ni-Co-Fe metal and Fe-rich glass (Nehru et al. 1974). Dowty et al. (1973) provided microanalyses of olivine, pyroxene and plagioclase (figures 5 -9).

Chemistry

The bulk analyses of 15610, 15633, 15641, 15643 and 15663 are all similar to other olivine-normative Apollo 15 basalts (tables, figure 12). The trace element content is always the same (figure 11). However, the variation in Mg content and Fe/Mg ration indicates addition of various amounts of cumulate olivine (figure 10).

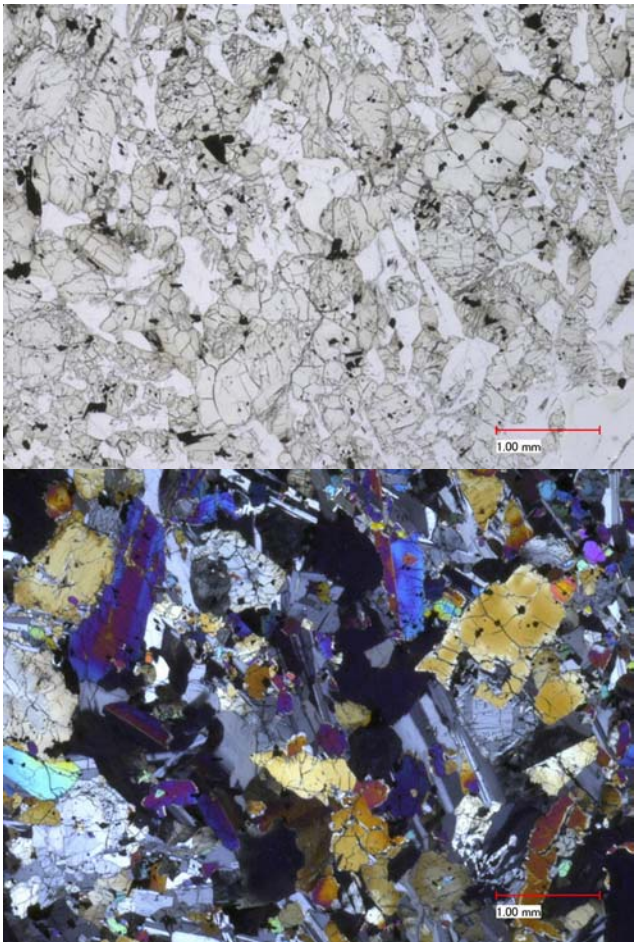

Figure 7a: Photomicrographs of thin section 15641,8 by C Meyer @ 50x.

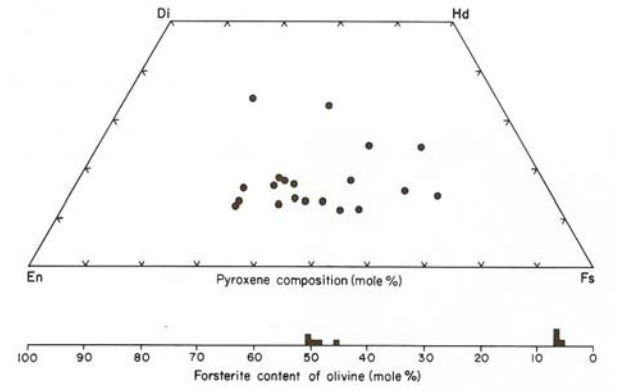

Figure 7b: Pyroxene and olivine composition of 15641 (Dowty et al. 1973).

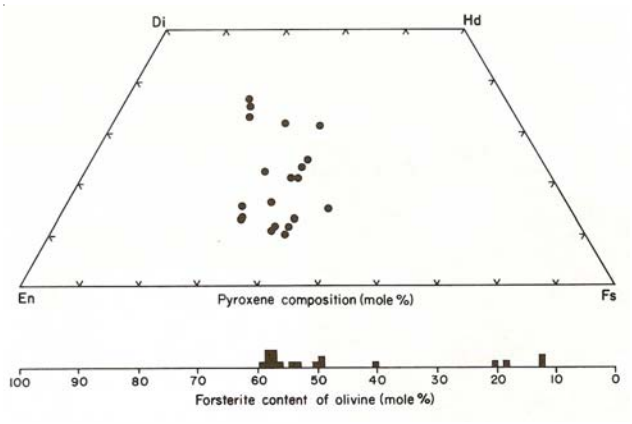

Figure 8b: Pyroxene and olivine composition of 15643 (Dowty et al. 1973).

Radiogenic age dating

15633 has been dated by the Ar/Ar plateau technique at 3.26 ± 0.05 b.y. (Husain 1974) (figure 13).

Cosmogenic isotopes and exposure ages

Husain (1974) determined an exposure age of 66 m.y. for 15633 by ^{38}Ar.

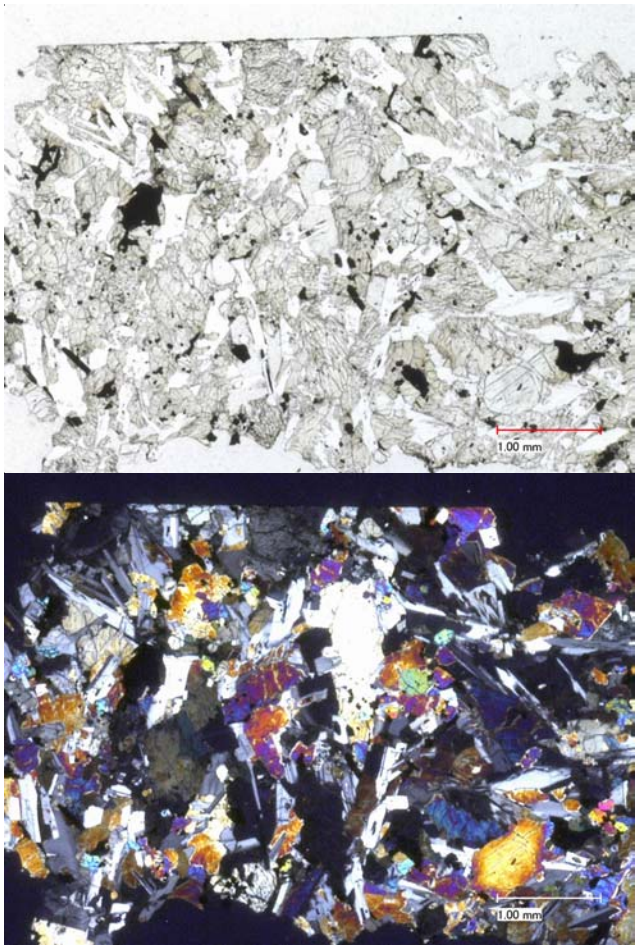

Figure 9a: Photomicrographs of thin section 15663,11 by C Meyer @ 50 x (bottom is with crossed polarizers).

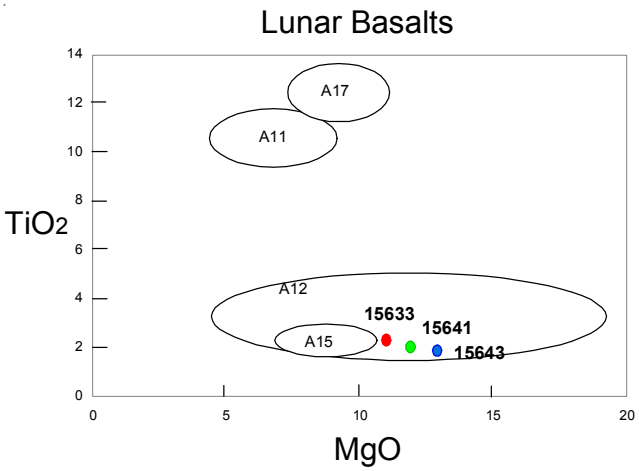

Figure 10: Chemical compostio of 15633, 15641 and 15643, compared with other Apollo basalts.

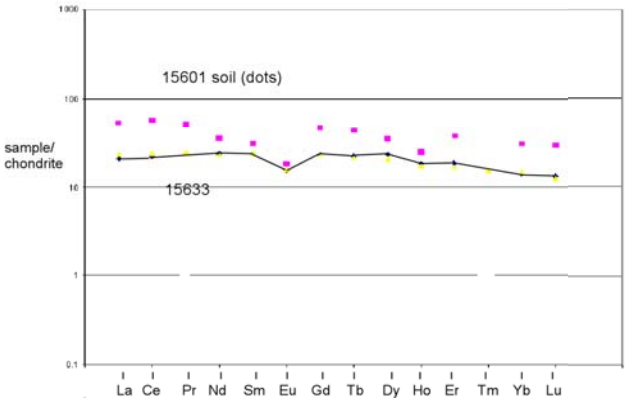

Figure 11: Normalized rare-earth-element diagram for 15633, compared with soils sample 15601.

Other Studies

Poupeau et al. (1972) studied solar flare tracks in 15641.

Processing

15663 was sawn.

There are 2 thin sections of 15610, 2 thin sections of 15633, 3 thin sections of 15641, 2 thin sections of 15643 and 4 thin sections of 15663.

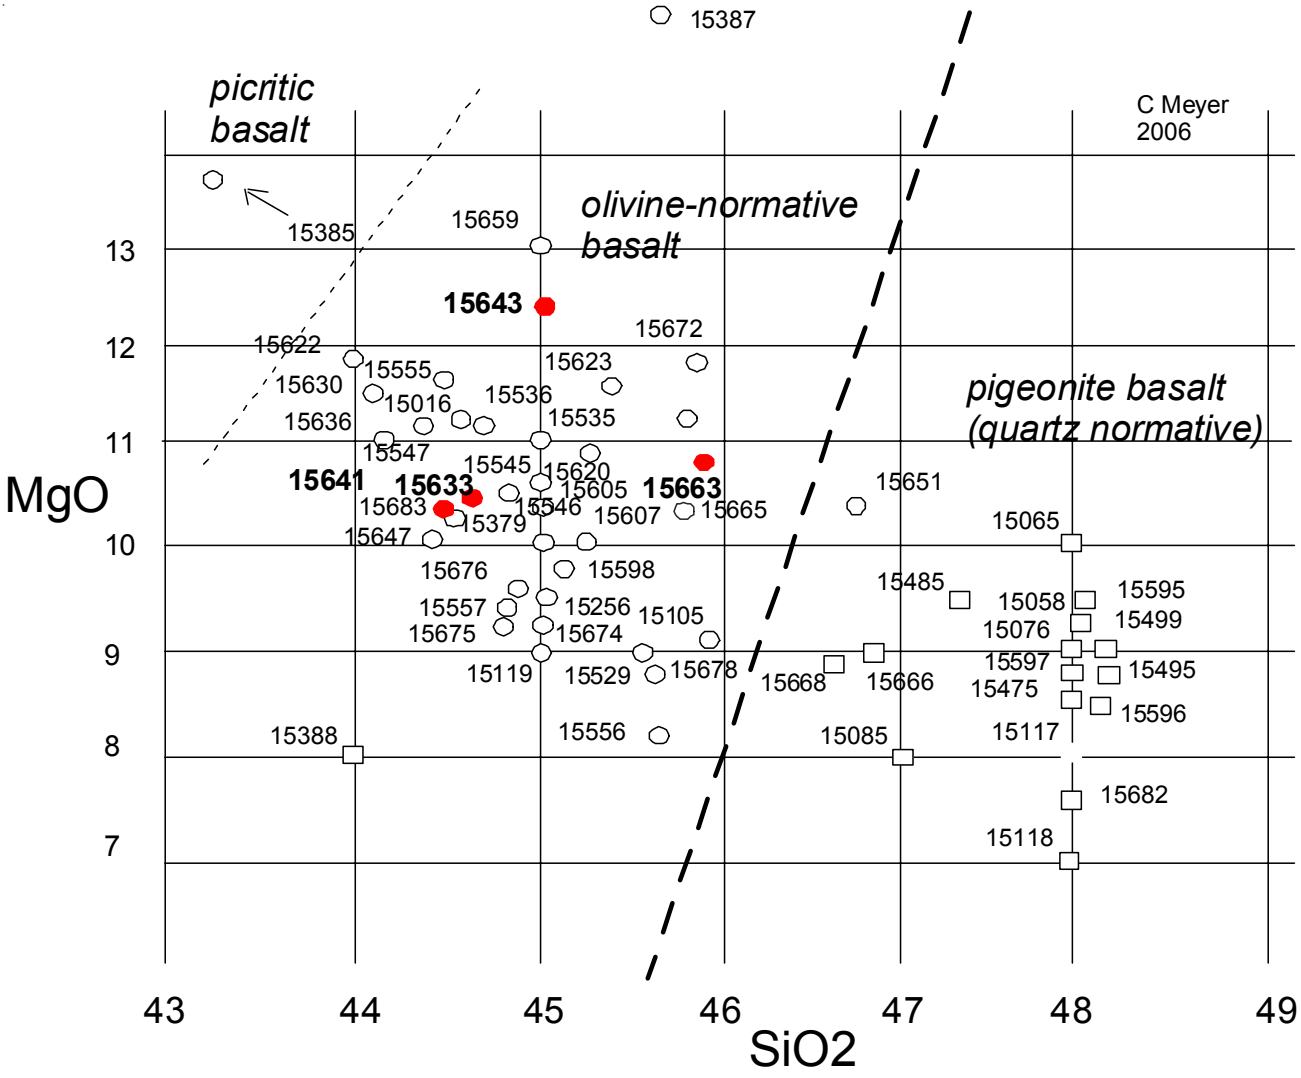

Figure 12: The really big picture.
