

**70135**  
Ilmenite Basalt  
446 grams

*Figure 1: Photo of 70135. Sample is about 10 cm across. NASA S72-56380. Note the dirty surface.*

*Figure 2: Photomicrograph of thin section of 70135 from Wolfe et al. (1981). Field of view is 6 mm.*

**Introduction**

70135 was collected from Geophone Rock, along with other smaller pieces (70136 to 70158) (figure 3). Geophone Rock was about 3 meters high and was

located at the ALSEP station about 150 m from the LM. It is a vesicular high-Ti basalt typical of the Apollo 17 site with a crystallization age of about 3.7 b.y. and an exposure age of about 110 m.y.

Part of the interest in Geophone Rock was that it was expected that it would be covered with the mysterious “dark mantle”, but the astronauts were unable to recognize such (see transcript).

**Petrography**

Brown et al. (1975) and others described 70135 as “plagioclase-poikilitic” (figure 4). Small olivine grains are found poikilitically enclosed in pyroxene and plagioclase. Rare armalcolite is found poikilitically enclosed in pyroxene. Roedder and Weiblen (1975) studied the silicate melt inclusions found trapped in ilmenite. Metallic iron and troilite are found in the mesostasis.

*Figure 3: Geophone Rock, located at the ALSEP site, about 150 meters from the LM, is ~ 3 meters high. Samples 70135 to 70155 were from the area indicated. NASA photo S17-147-22536.*

LMP Bag 10 echo (70135) is a sample of a very large boulder that's just beyond geophone 3. It's the same kind of rock I saw near the LM – and the Gabbro – I'm beginning to lean towards 50% plagioclase, though. I see no clear alignment of plagioclase or pyroxene in it. That's the one with the parting in it. It looks as if – integrating what I've seen here and over at the big rock – the geophone rock – that the layering or the foliation or the parting, whichever it is, is the result of variations in vesicle concentrations. The sample 10 echo (70135) is a sample of the more coarsely vesicular rock. I could not get one of the finer – more finely or nonvesicular fragments. But I got pictures of it.

Neal et al. (1989) and Neal and Taylor (1993) reported on the mineralogy and petrography of the smaller samples from this same basaltic boulder.

### **Mineralogy**

***Pyroxene:*** Although mineral chemistry for 70135 is unknown, Neal et al. (1989) and Neal and Taylor (1993) reported pyroxene compositions of some of the smaller fragments (summarized in figure ) that were also sampled from Geophone Rock.

Figure 4: Photomicrograph of thin section of 70135 (from Lofgren and Lofgren 1981). Scale is 1 mm.

**Opagues:** El Goresy and Ramdohr (1975) studied the subsolidus reduction of ilmenite and chromite. Analyses of metallic iron are not given.

**Rutile:** El Goresy and Ramdohr (1975) gave analyses of rutile in 70135 (table 4) and noted that Zr was enriched. Neal et al. (1989) also reported rutile in 70138. It apparently forms by exsolution from early formed ilmenite.

### Chemistry

Rhodes et al. (1976), Laul et al. (1974), Rose et al. (1975), Shih et al. (1975), Korotev and Haskin (1975), and Dickinson et al. (1989) found widely variable results (table 1). Something is wrong (figure 7). Either the samples included the soil seen attached in figure 1, or there was a mistake in sample numbers. Korotev and Haskin (1975) discussed the sample size limitations. The only satisfactory resolution would be to prepare a large clean sample, and create a powder for carefully planned analyses.

Figure 5: Composition of olivine and pyroxene in samples of Geophone Rock (from Neal and Taylor 1993).

Ma et al. (1979) and Neal et al. (1990) analyzed the smaller fragments also chipped from Geophone Rock (table 2). These analyses were consistent, and may give the best value for Geophone Rock. It is interesting

### Mineralogical Mode of 70135

	Roedder and Weiblen 75	Brown et al. 1975	(70138) Neal et al. 1989	(70139) Neal et al. 1989	(70145) Neal et al. 1989
Olivine	3.8	2.8	3	2.5	2
Pyroxene	51.6	46.2	49.7	35.8	42.5
Plagioclase	23	28.4	22.2	41.6	32.5
Oxides	19.4	21.9	24.1	15.8	24.1
Metal	0.2		1	2.4	1.3
Silica	0.6	0.3		1.9	
Mesostasis	1.4	0.4			

Figure 6: Chemical composition of Apollo basalts with 70135.

Figure 7: Normalized rare-earth-element diagram for splits of Geophone Rock (table 1 and 2).

to note that classification of these basalt samples varied from type A to type B!

Gibson et al. (1976) reported 1680 ppm sulfur in 70135. Jovanovic and Reed (1975 on) reported on halogens, Ru and Os.

### Radiogenic age dating

Nyquist et al. (1975, 1979) dated 70135 by Rb-Sr and Sm-Nd internal mineral isochrons (figures 9 and 10). Paces et al. (1991) reported an age for 70139 from the same rock, as well as whole rock data for 70138 (also from Geophone Rock).

Figure 8: Trace element diagram for Apollo 17 basalts.

### Cosmogenic isotopes and exposure ages

Cosmic-ray induced activity of  $^{22}\text{Na} = 33$  dpm/kg.,  $^{26}\text{Al} = 38$  dpm/kg.,  $^{54}\text{Mn} = 56$  dpm/kg.,  $^{56}\text{Co} = 56$  dpm/kg. and  $^{46}\text{Sc} = 32$  dpm/kg. was determined by radiation counting of 70135 (O'Kelley et al. 1974). Interestingly this high activity could be traced to intense bombardment by solar wind protons on Aug 4-9, 1972, prior to the Apollo 17 mission.

The exposure age by  $^{81}\text{Kr}$  was reported as 106 m.y. by Arvidson et al. (1974).

### Other Studies

Brecher (1977) and Cisowski (1983) reported on the magnetic properties of 70135. This magnetic data is interesting in light of the reduced iron found in this rock.

### Processing

A small slab (1 cm thick) was cut from one end of 70135 (figure 11). There are 10 thin sections.

### Summary of Age Data for 70135

	Rb/Sr	Sm/Nd
Nyquist et al. 1975	$3.75 \pm 0.09$ b.y.	
Nyquist et al. 1979		$3.77 \pm 0.06$
Paces et al. 1991		$3.71 \pm 0.12$

**Caution: Beware changing decay constants!**
